

Minerals Commission

Memorandum

From : HME

To : CEO

Ref : BODUKWAN HOLDING LIMIMITED COMPANY_25-1

Date : 27/5/2025

**Subject: BODUKWAN HOLDING LIMITED COMPANY'S FIELD REPORT
REVIEW COMMENTS**

Bodukwan Holding Limited Company conducted a 22-day (26th March 2025 to 16th April 2025) reconnaissance survey on their four prospecting licences. The company identified some targets for further work. Generally, the work done is good and the results promising. The recommendations of the team of geologists are good and should be given consideration.

Please find attached the review comments on the company's field report.

A handwritten signature in black ink, appearing to read "Michael Kotoka", is written over a circular stamp.

REVIEW COMMENTS ON BODUKWAN HOLDING LIMITED COMPANY'S FIELD GEOLOGICAL REPORT

INTRODUCTION

A team of 5 geologists (2 expatriates and 3 Ghanaians) conducted a 22-day (26th March 2025 to 16th April 2025) reconnaissance survey on Bodukwan Holding Limited Company's prospecting licences. Table 1 is a summary of all the prospecting licences of the company.

Table 1: Summary of the four prospecting licences of Bodukwan Holding Limited Company

LICENCE NAME	PL NO	LOCATION	DISTRICT	REGION	SIZE/KM2	START	EXPIRY	APPLIED
Moseaso Odumase	PL 2/803	Moseaso	Amansie West, Amenfi West District	Western North	33.81	20/10/2023	19/10/26	
Atoborakurom 1	PL 6/493	Atoborakurom	Bekwai Municipal, Amansie West, Amansie Central District	Ashanti	133.4	26/4/22	25/4/25	9/4/2025
Atoborakurom 2	PL 6/494	Atoborakurom	Bekwai Municipal, Amansie West, Amansie Central District	Ashanti	153.6	26/4/22	25/4/25	9/4/2025
Agroyesum	PL 6/802	Agroyesum	Amansie West, A	Ashanti	21	20/10/23	19/10/26	

The company applied for renewal for both Atoborakurom 1 and 2 but used work program dated March 2022.

SUMMARY OF FIELD WORK

The work accomplished by the team during the 22-day field period included identifying the proposed targets, structural mapping, visiting various artisanal activities (alluvial and colluvial) and identifying potential areas for channel sampling.

Proposed target identification

Bodukwan Holding Limited Company's licences have 17 targets identified, including three from the Boni licence, five from the Atobrakrom licence, and two from the Agroyesum licence. Ten targets were planned at Moseaso, with five each inside and outside the licence area. Some targets were shifted due to floodplains, such as in the Boni licence, where two target points were within floodplains. All five targets in the Atobrakrom licence were on elevated ground, with two near abandoned colluvial mining sites. In the Agroyesum licence, one target is in a town, another near colluvial mining activities, and the third is on a hill.

Structural mapping

The structural mapping exercise, focusing on road cuts, drainage exposures, and colluvial mining sites, was conducted. The team observed phyllite, fabrics of the mottled zone, and quartz veins and stringers. The metasediment, primarily phyllite, dips to the northwest, with a strike angle ranging from 190 to 234 degrees. Quartz veins display varying orientations, with

some dipping to the southeast and others to the southwest. At Agroyesum area, dip directions are both northwest and southeast, suggesting an anticline structure. Evidence of faulting is also present, with one valley featuring a sinistral displaced quartz vein. The dip angle in the metasediment varies from 45 to 83 degrees, with some veins exhibiting shallow dips.

Sampling.

A total of 77 samples were taken from all the 4 concessions. One of the channel samples at Moseaso return assay results as high as 18.26g/t. A grab sample from Atobrakrom Crossline returned 0.13g/t, Agroyesum Crossline returned 0.21g/t, and Boni auger sample returned 0.09g/t.

SUGGESTIONS/RECOMMENDATIONS BY THE COMPANY

The following suggestions and recommendations are made for considerations.

- 1. Follow up on Moseaso, especially the channel sample anomaly at 18.26 mg/kg by extending the concession as shown in yellow outline below.*
- 2. Cluster analysis around moderate anomalies (Atobrakrom, Agroyesum) might identify gold-in-soil trends or structures. Therefore, trenching and RC drilling would be required.*
- 3. Consider follow-up sampling, pXRF mapping, or geophysics in those target areas.*
- 4. Relinquish the whole of Boni Concession to Mincom in order to reduce renewal cost.*
- 5. Mining Leases for Moseaso, Atobrakrom and Agroyesum may be initiated while completing the geological works.'*

GENERAL COMMENTS

The work done is good and the results promising. The recommendations of the team of Geologists are good and should be given consideration.
